

docs.google.com/forms/d/e/1FAIpQLSd_ZHbVAyirjcBMHBdaQLb5IPY4zdgzUFTCrPGBuEXd9ymIA/viewform

You need to make a google form then when you click on the eye at the top you will be given the URL that you then copy in the DrivePost script but don't put in the /viewform so in the case you would use everything from [https://docs.....](https://docs.google.com/forms/d/e/1FAIpQLSd_ZHbVAyirjcBMHBdaQLb5IPY4zdgzUFTCrPGBuEXd9ymIA/) ToymIA Then you will make all of the fields you want per post in the form and copy each name entry ID into the corresponding element in the DrivePost script. I will have an example prefab that shows all of this filled out with dummy content.

The screenshot shows a Google Form titled "VR Technology Acceptance Model Instrument-Fast Form". The form includes a required text input field labeled "Your answer" and a Likert scale question about dental treatment techniques. The developer tools overlay on the right shows the DOM structure, highlighting the `name="entry.1593390322"` attribute on the text input field's `input` element.

This is where you will find the entry ID you will have to right click on each element and "inspect element" to get the inspector to come up. Then just look for the corresponding `name="entry.*****"`
